

NEW PRODUCT LAUNCH FEBRUARY 2013

Anti-Germ™, a completely safe **antibacterial coating** which is now available on our **ISEO panic exit devices**.

Anti-Germ™ is a permanent antibacterial treatment which slowly and constantly releases silver ions. These ions penetrate microbial organisms on the treated surface, attacking their DNA and preventing them from reproducing. This continuous protective action kills more than 650 viruses, molds, alga, mycosis and bacteria species (such as Legionella, Salmonella and MRSA) making it perfect for any application, but particularly beneficial in areas where hygiene is of optimum importance. Areas such as hospitals, health clinics and care homes are the obvious places that will benefit, but other useful applications include child care and community centres, food preparation/serving/restaurant areas, and any high traffic areas such as airports and rail stations.

The antibacterial properties are permanent so no on-going maintenance is required to maintain the high level of protection offered by the coating. Even in the event of the surface becoming scratched it will still continue to offer the same uninhibited level of protection so your clients can rest assured that once it is fitted, it is quietly doing its job killing bacteria on contact.

We are also able to offer antibacterial coatings within our Architectural Hardware Range. For further information please contact the office.
